

Sprint Retrospective — Worked Example

What went well · What did not go well · What could be improved

Worked example (group) using the amateur dance club app from Lecture 04 (“A more detailed example”). Your project will be different; use this to see the level of detail expected.

Group #	Example	Project Topic	Amateur Dance Club App	
Team Member Names	Ana	Ben	Chen	Dev
AI tool(s) used: Model + Version + Effort	Opus 5.5 Medium, GPT-5.6 Sol High			

About this template

The Sprint Retrospective is the development team reflecting on the Sprint just finished: what went well, what did not go well, and what could be improved for the next Sprint. It is about looking for ways to improve the process.

In this lab, AI is part of your team.

- Group: your team is your teammates and AI.
- Individual: your team is you and AI.

What to submit

- **Everyone:** Sections 1–3.
 - Section 2: at least 1 entry for “What went well” and at least 1 entry for “What did not go well”. Each entry at least 30 words, with a specific example from this Sprint.
 - Section 3: at least 1 action.
- **Group:** answer Sections 2 and 3 together, as one group. You need 1 entry per row from the whole group, **not 1 entry per person**. For example, a group of 4 writes 1 “What went well” entry together, not 4 separate entries.
- **Group only:** Section 4, with 1 row per team member and one specific sentence in each cell. This is the only section where each person answers separately.
- **Individual:** delete Section 4. In Section 1, write the User Story you built and list your tasks (individuals do not submit a Sprint Backlog).

Guidance: things to think about (you do not need to answer all of these)

- **AI as a teammate (group and individual):** Which tasks did you give AI? Where did it speed you up or slow you down? How did you check its work? Would you give it the same tasks next Sprint?
- **Working as a team (group only):** dividing tasks, “Daily Scrums”, merging code, blockers, communication.

1. Sprint Summary

Sprint #	Dates	Selected User Story(ies) <i>Story ID + user story</i>	Tasks done / planned <i>Group: from your Sprint Backlog. Individual: list them here.</i>
1	9-Oct – 30-Oct	US-1.2 As a treasurer: record which members attended each practice so that I know who owes for that session	4 / 4

2. Working with AI

	Entry <i>At least 30 words, with a specific example from this Sprint. Add rows for more entries.</i>
What went well	Opus 5.5 wrote the first version of the attendance screen for T-1 in minutes, including the checkbox list of members. Ana only had to rename fields to match our database, which saved most of the 6 hours we estimated for that task.
What did not go well	GPT-5.6's code for T-3 saved attendance but overwrote earlier practices each time, so past practices showed empty. Our acceptance criterion "attendance can be viewed for past practices" caught it in testing, but Chen spent an extra 3 hours finding the bug.

3. What Could Be Improved: Action Plan

Action <i>At least 1. What will you do differently next Sprint?</i>	How we'll know it worked
Ask the AI to also write a test for each acceptance criterion, and run the tests before merging code.	No bugs against acceptance criteria are found after merging in Sprint 2.

4. Team Member Voices (Group only)

Team Member	One thing that went well <i>One specific sentence</i>	One thing to improve <i>One specific sentence</i>
Ana	Splitting the story into four tasks meant everyone knew what to do on day one.	I waited too long to ask for help when my screen wouldn't connect to the database.

Team Member	One thing that went well <i>One specific sentence</i>	One thing to improve <i>One specific sentence</i>
Ben	Our quick Daily Scrums in lab kept us on track and surfaced blockers early.	We should merge code more often; one big merge at the end caused conflicts.
Chen	Reviewing each other's code caught two bugs before testing.	I should update my Remaining hours as I go, not at the end of the Sprint.
Dev	Testing against the acceptance criteria made it clear when we were done.	We should agree on naming conventions before anyone starts coding.

Example shows a group of 4. An individual submission has no Section 4.
